Applying the Bologna Principles in an Information Science Course

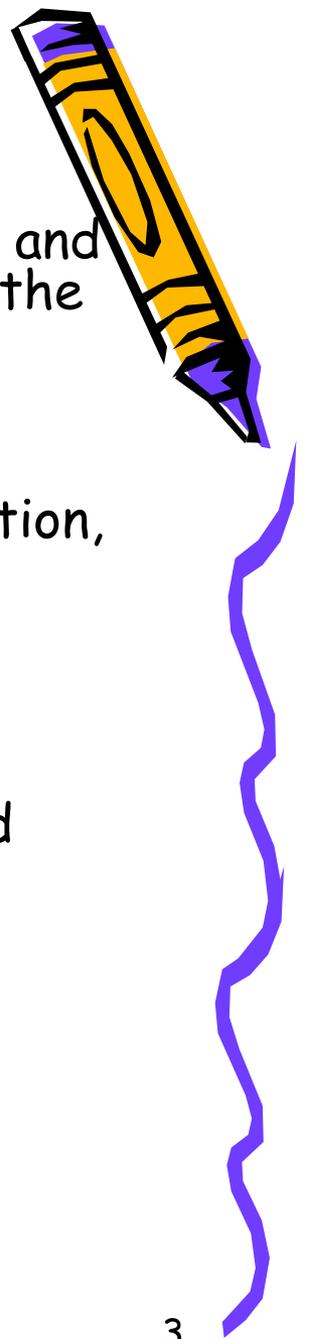

The subject of this paper has been suggested by professor Jadranka Lasić Lazić in the frame of her course on **Retrieval and Indexing Systems** at the Information and Science Departement, Faculty of Humanities and Social Sciences, University of Zagreb.

Casablanca, 2007

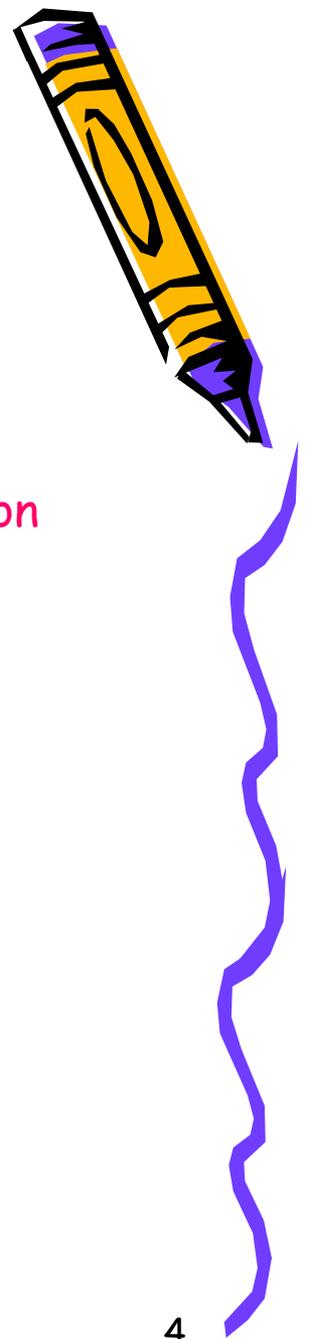

Reasons Why

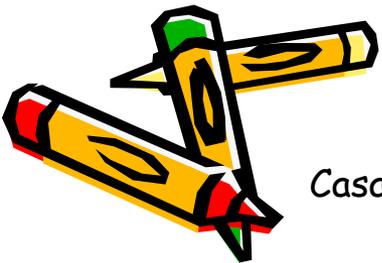

- to introduce a Croatian National Educational Standard- and organize a lifelong learning system on the principles of the **Bologna declaration**
- to analyse the nature and extent of a major **curricular change** in LIS (Library and Information Science) education,
- to decide **on methods** used to collect data, including surveys, case studies, content analysis, and interviews.
- to verify **all data collected** interviewing were conducted with selected faculty members and students.

Perspectives for an information science curriculum according to Bologna Principles

- stronger **information technology** infrastructure,
- more effective use of technology to **support curricula**,
- development of broader frameworks for **examining information problems**,
- increased **interdisciplinarity**,
- emergence of **curricular innovations**,
- more effective delivery of **distance learning**,
- greater **flexibility** in program delivery, and
- the emergence of a more **student-centered** curriculum.

On Bologna Declaration

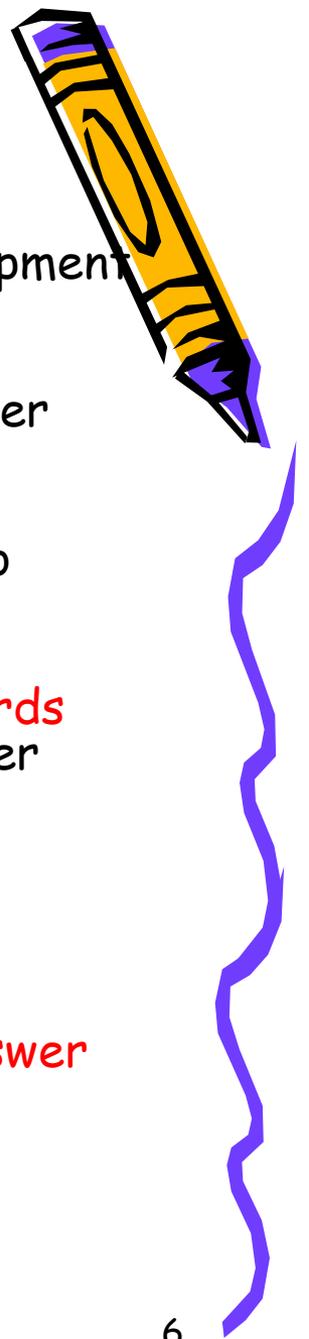

- A joint declaration of the **European Ministers of Education**,
- convened in **Bologna** on the 19th of June 1999,
- a pledge by 29 countries **to reform** the structures of their **higher education systems** in a convergent way.
- not just a political statement, but a **binding commitment** to an action program,
- increases the global competitiveness of **European higher education**.
- an organized **follow-up structure** and process,
- invites the higher education community **to contribute** to the success of the process of reform and convergence.

Casablanca, 2007

Bologna Declaration in Croatia

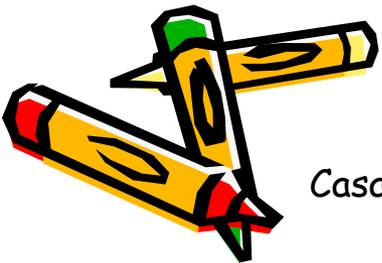

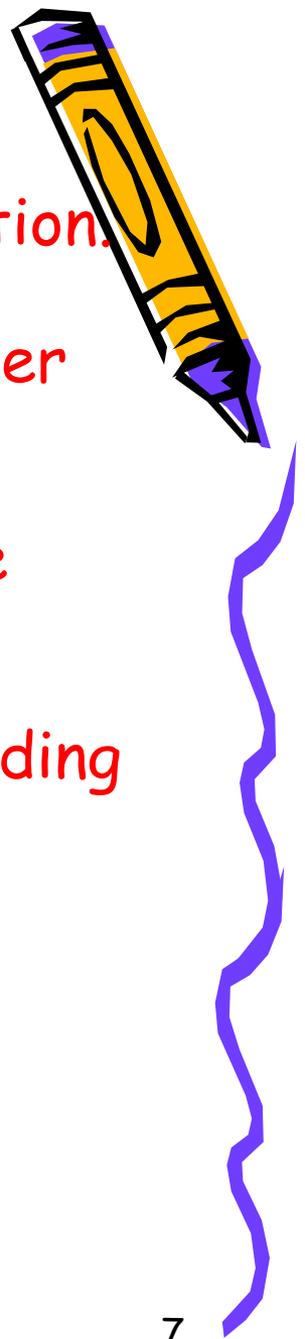

- It is a key document that marks a **turning point** in the development of European higher education.
- It is **not a reform imposed upon national governments** or higher education institutions.
- It is **a commitment freely taken** by each signatory country to reform its own higher education system.
- It aims at creating convergence and, thus, is **not a path towards the "standardization" or "uniformatization"** of European higher education.
- The fundamental principles of **autonomy and diversity** are respected.
- the Declaration reflects a **search for a common European answer to common European problems**

Casablanca, 2007

Bologna Declaration and Knowledge Society

- Knowledge society requires **permanent education**.
- A worker, particularly a specialist, should **never stop learning**.
- To keep up with technology and new ideas **the need for lifelong learning** arises.
- To increase support for it **comprehensive reading** is a very important means.
- To be remembered **without life-long learning there is no life-long earning**.

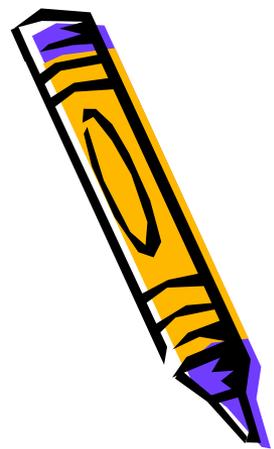

Scholarly articles

- They begin with an *Abstract* or summary.
- In the *Introductory part* the *Purpose, Problems, Hypotheses* are defined.
- The *Methods & Procedures* deal with why, where, and how the study was performed.
- Finally The *Results, Discussion and Conclusions* explain the findings
- and *compare* them with related ones.

Longlife learning support **based** on comprehensive reading

How can we help our students develop lasting **habits of reading comprehension**?

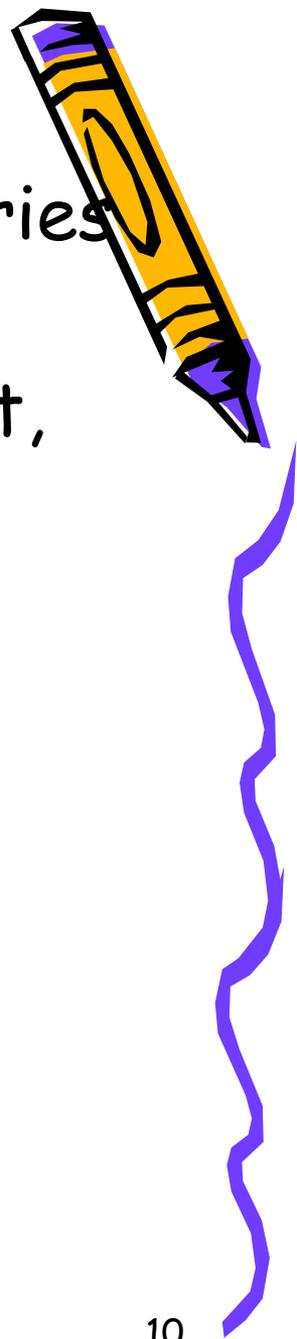

How can we integrate helpful and **motivating** assessments?

How can we meet the **information literacy needs** of students with widely varied reading levels and backgrounds?

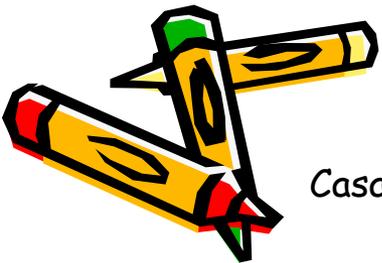

How can we make our students aware of the **special reading skills** required of an information specialist?

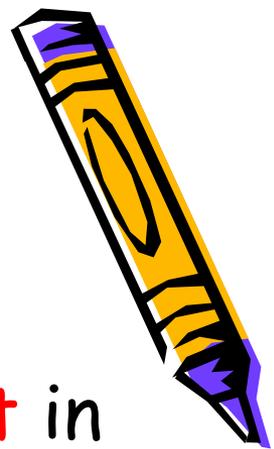

Comprehensive Reading

- is explained by some educators as a series of **subskills**, such as:
 - **understanding** word meaning in context,
 - making **inferences** about information implied,
 - finding the **main idea**
 - and distinguishing between **facts** and **opinion**.

Understanding

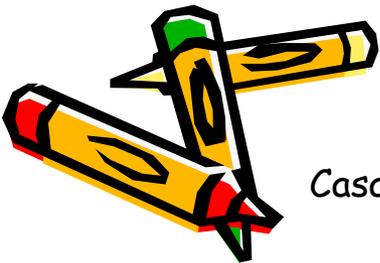

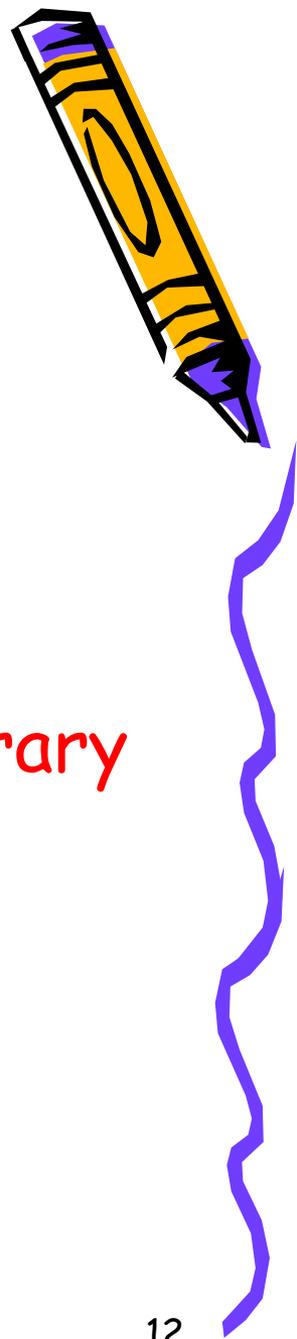

- **Reading materials** become more **abstract** in high school and college
- and contain more **technical vocabulary**.
- The students must **acquire new information**
- but also they must critically **analyze** it.

Comprehensive reading of scholarly (or scientific) articles

- A scholarly article uses a **specific vocabulary**.
- It is **difficult to grasp** the content.
- Some journals have their **specific literary style**.
- Their **structure** is standardized.

Objectives

- In a pilot study, we wanted to find out if the students have **understanding** and interpretation problems with some **specific sections** of a scholarly article.
- At the beginning level of the project, the students have been asked to choose for reading an **article** from an information science journals.
- After having read it, they had to photocopy it and attach to their **term paper**. The titles of the journals and their ISSN are given in our paper.
- In their term paper, they had to write a **short overview** of the subject of the article and supply bibliographic citations
- and **answer the questions** and subquestions in the given **questionnaire** to gather data for statistical processing.

Questionnaire

- **Title.** Was the subject of the article clearly expressed in its title?
- **Purpose.** What was the purpose of the introductory part of the article?
- **Problems.** What did you learn from its introductory section?
- **Hypotheses.** What was the problem or the question that was studied (or what were the hypotheses of the study)?
- **Methods&Procedures.** What is the theoretical base of the study?
- **Results.** What is the result of the study? What were the data and how are they presented?
- **Discussion.** What is said in the discussion section of the article? Are there some assumptions about the practical applications of the study?
- **Conclusion.** What is the achievement of this study in the field of information science?
- **Abstract.** Did you meet your expectations about the value of the article because you selected it for reading?

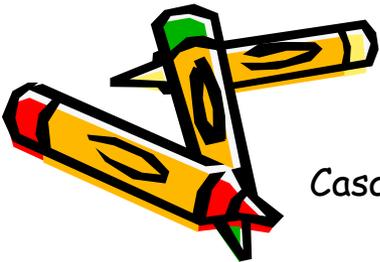

Procedures

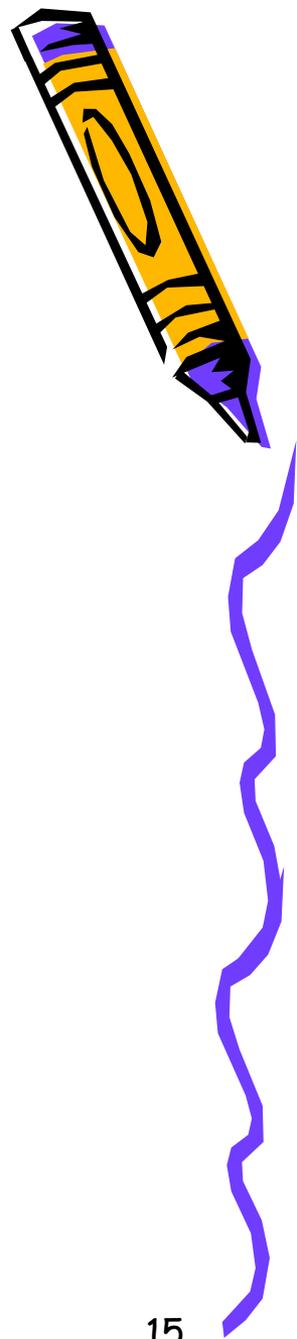

The answers were given **verbally**, processed and presented in the **Table** in four categories:

- affirmative answers as **Understood&explained**,
- not clear answers as **Vague or not understood**,
- the remaining two as **Not sure** and **No answer**.
- Detection of **differences** among the categories was made possible by homogeneity of classification.
- It had to be established **which sections** of a scholarly article are **easier** to understand and which are more **difficult**.

The statistical survey of the 270 answers to the 9 questions of 30 students follows in tabular and graphical forms.

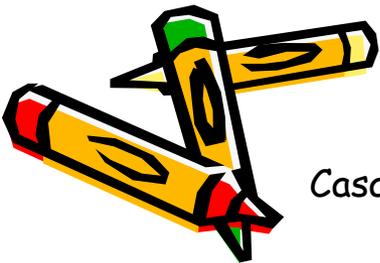

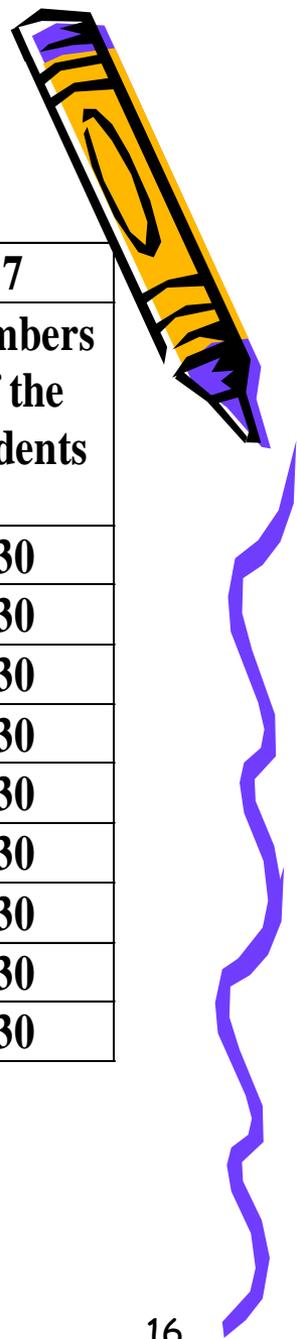

Casablanca, 2007

Table

270 answers to the 9 questions of 30 students

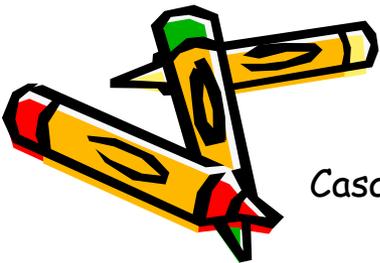

1	2	3	4	5	6	7
Question	Section	Understood & explained	Vague or not understood	Not sure	No answer	Numbers of the students
1	Title	20	10	0	0	30
2	Purpose	30	0	0	0	30
3	Problems	24	6	0	0	30
4	Hypotheses	10	7	13	0	30
5	Methods & Procedures	20	3	7	0	30
6	Results	15	8	0	7	30
7	Discussion	15	8	0	7	30
8	Conclusion	24	0	6	0	30
9	Abstract	15	10	5	0	30

Methods I

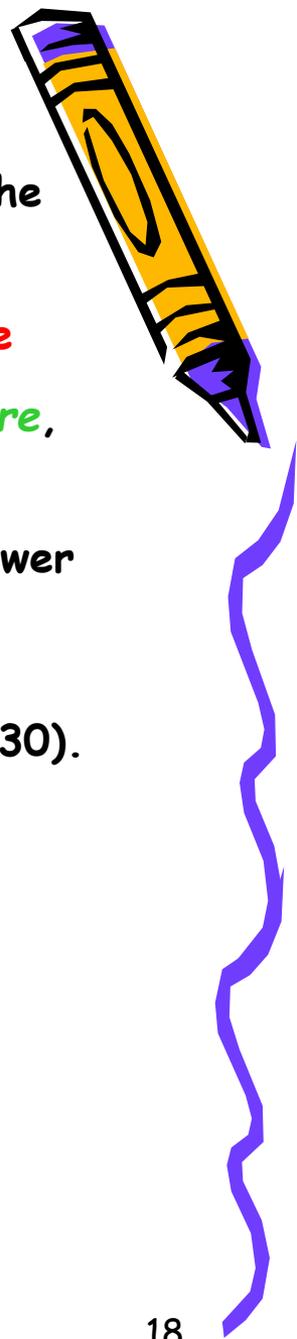

- The population of 30 individuals in the pilot study makes it possible to apply some statistical measures based on the so called **nominal scale**.
- The names assigned to the categories in columns 3 to 6 of the table, (i.e. sections of an article) serve as a **nominal scale**.
- **Classification** is fundamental to any science, all measurement involves it as a **minimal operation**.
- **Classification** is the **lowest level of measurement** in the broadest sense of the term.

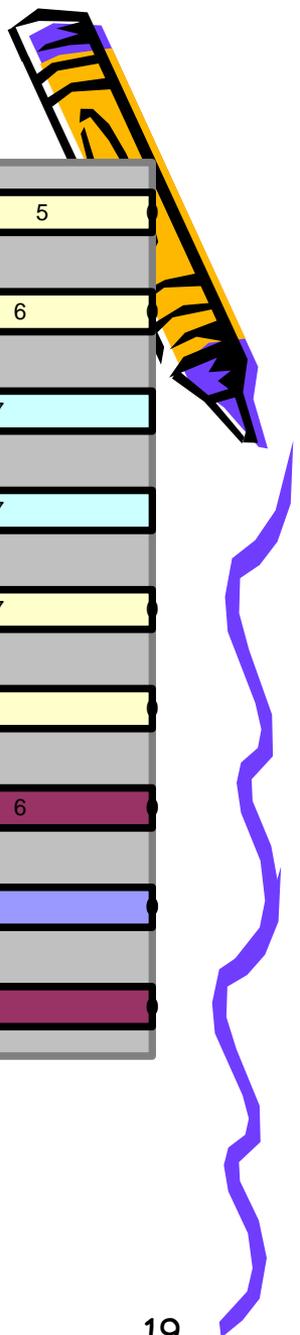

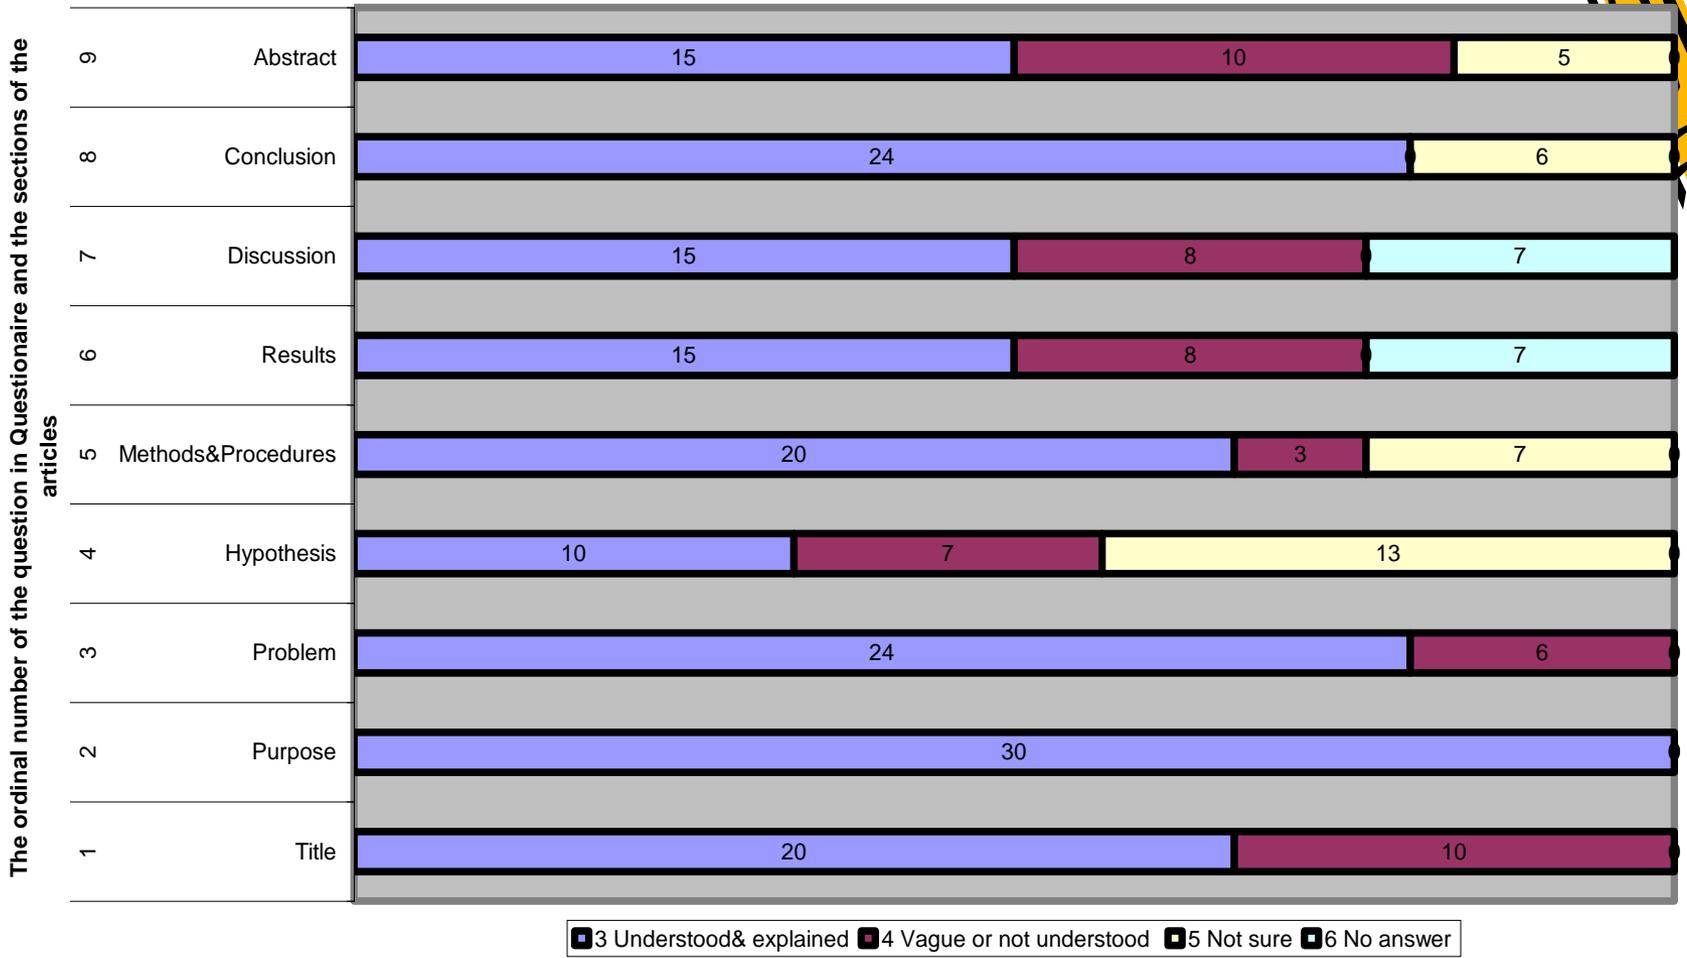

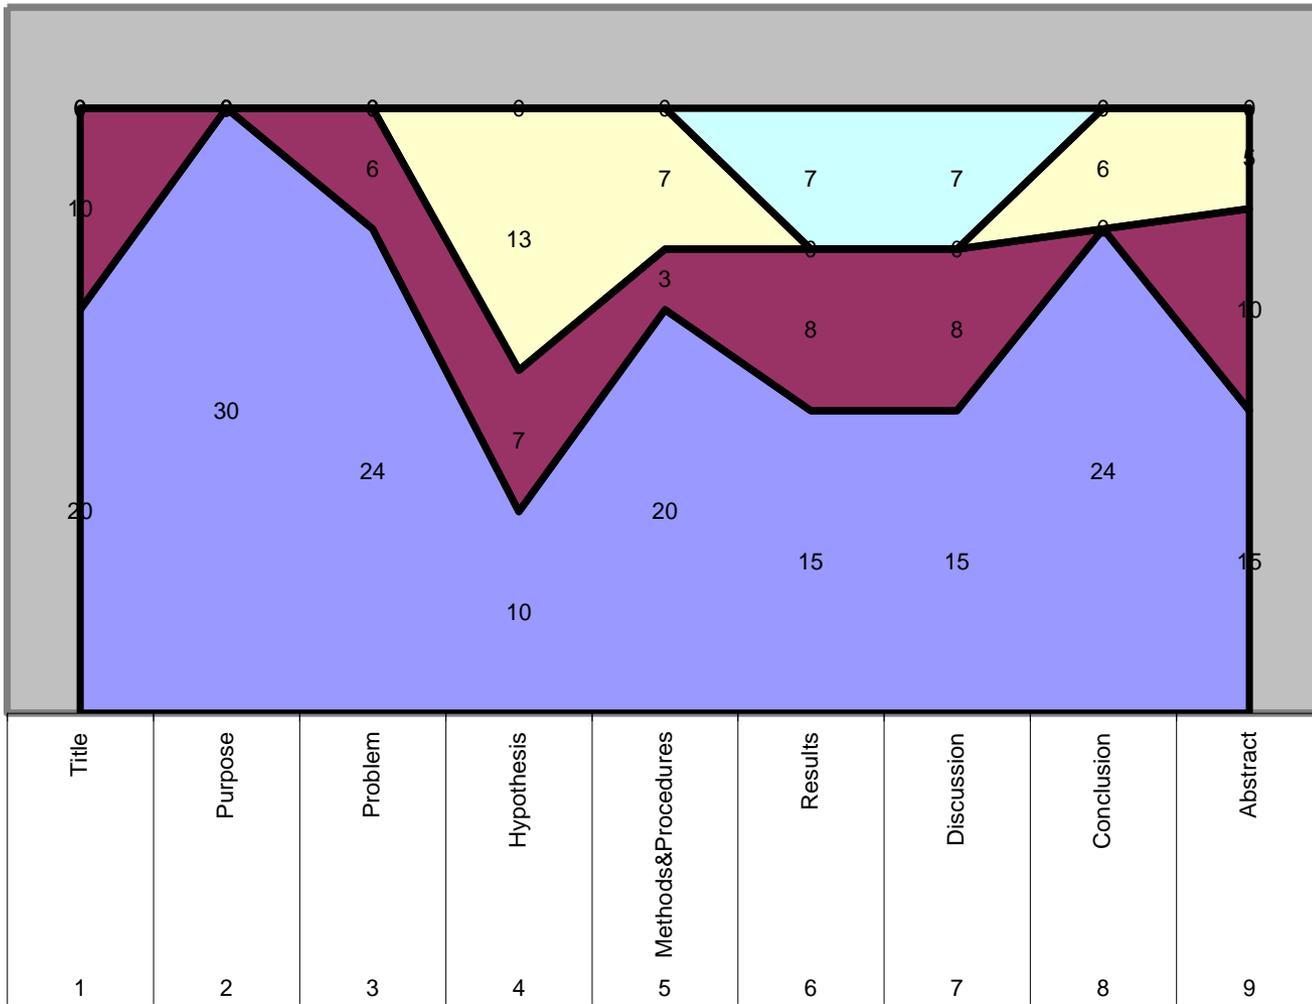

Methods 2

- The **nominal scale** constitutes the minimal condition necessary for the application of **numeric statistical procedures**.
- The **nominal scale** enables the counting and numerical processing **the number of answers in the four categories** in Table: **Understood & explained** column six **Vague or not understood**, column seven **Not sure**, and column eight with **No answer**.
- The categories are **mutually exclusive and exhausted**, i.e. each answer given by the participants is placed in one and only one category.
- The **proportion of answers** is defined as the quotient between the number in the relevant category and the total number of answers (30).
- The **proportions** make it possible to perform a **direct comparison** among rows (questions) and columns (answers).
- A **graphic overview** of the results obtained is presented in **charts** accompanying the Table.

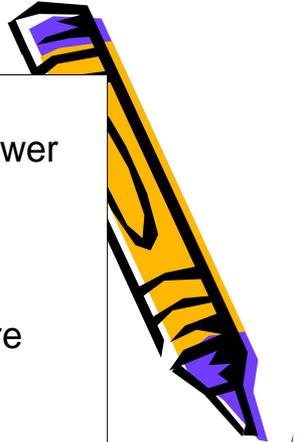

Percentage of understanding among the sections of articles

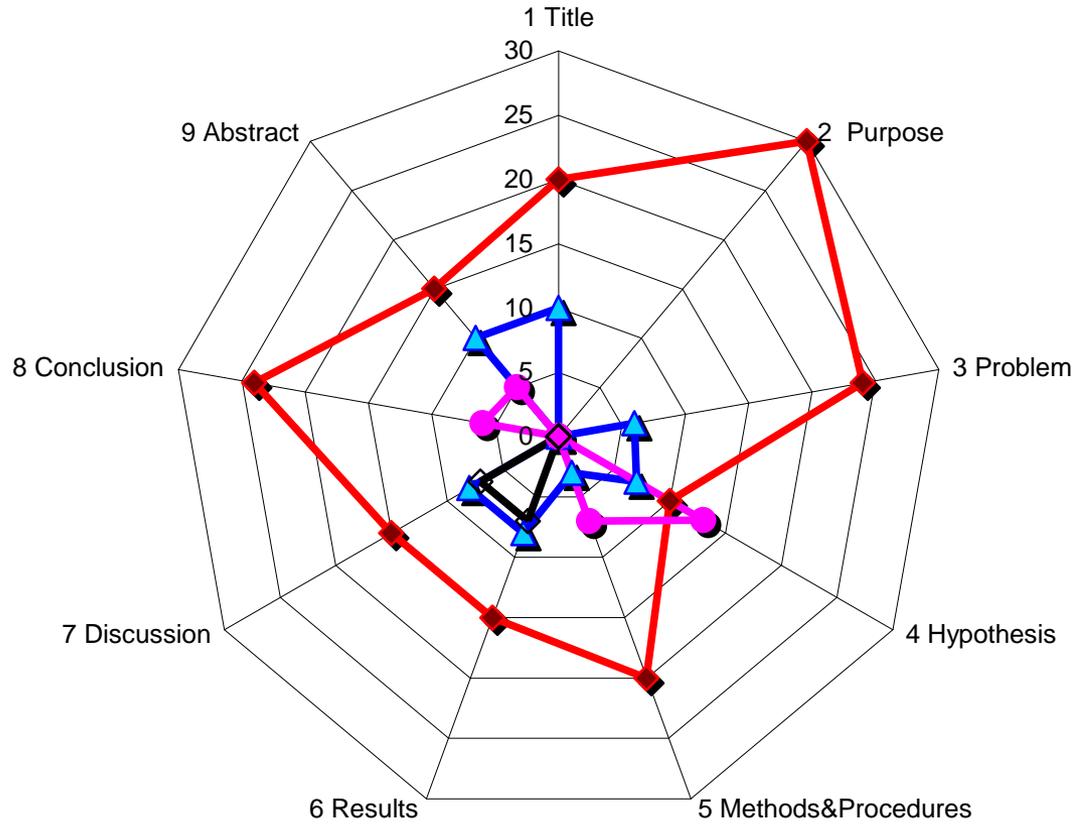

- 6 No answer
- 5 Not sure
- 4 Vague or not understood
- 3 Understood & explained

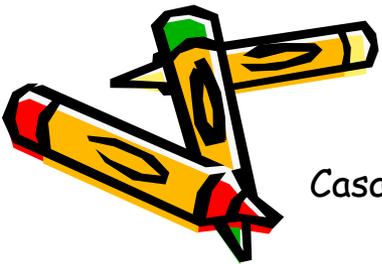

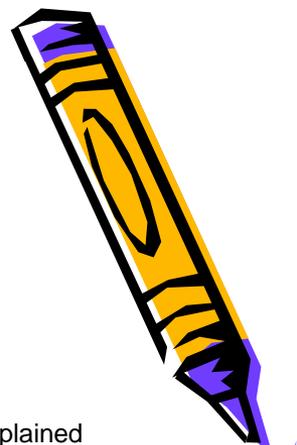

Casablanca, 2007

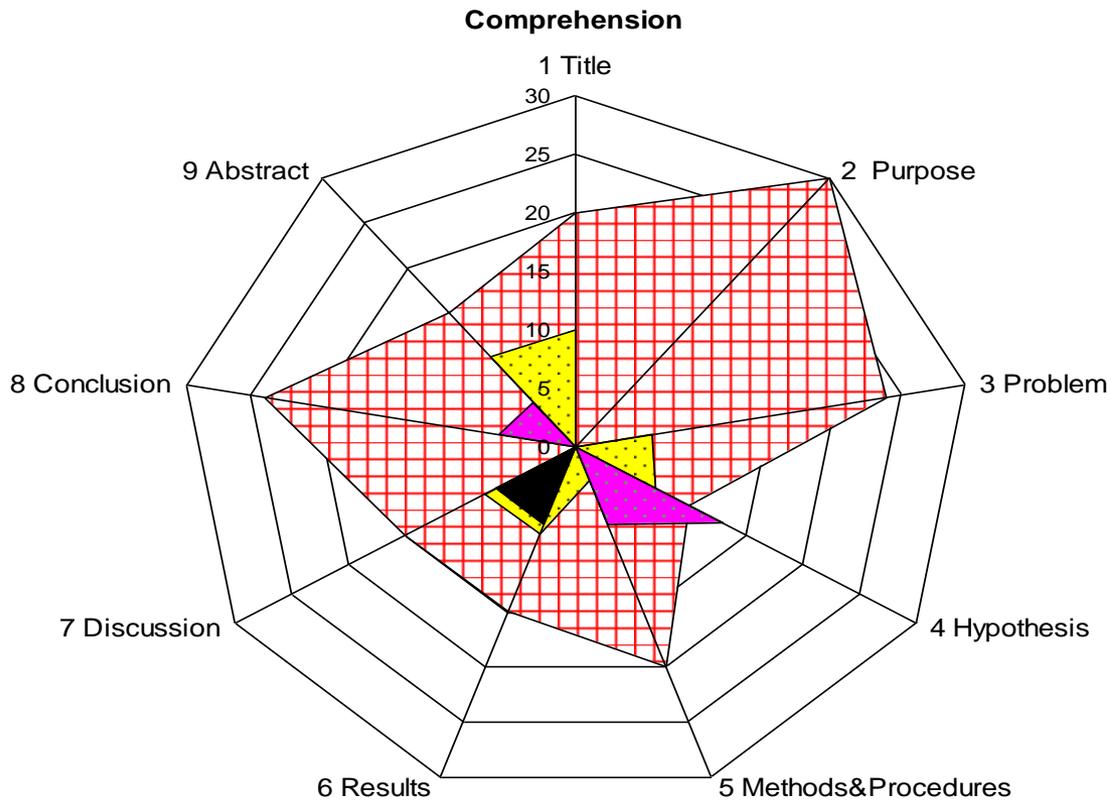

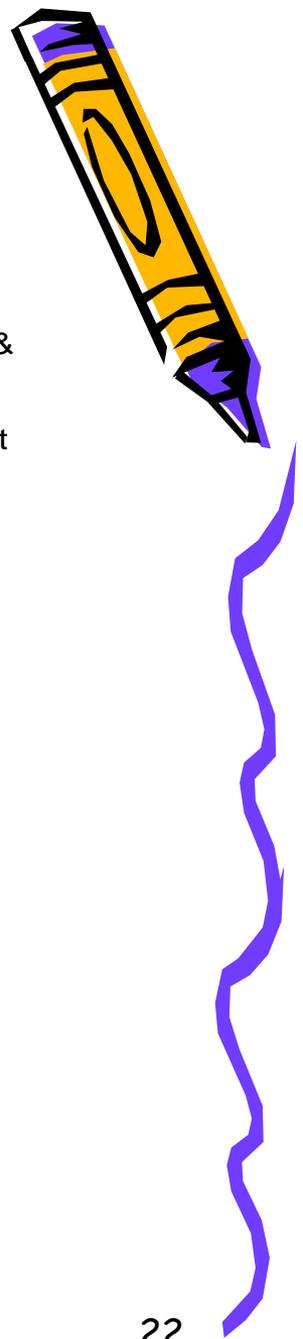

Connected point diagram

- 3 Understood & explained
- 4 Vague or not understood
- 5 Not sure
- 6 No answer

Casablanca, 2007

- 3 Understood & explained
- 4 Vague or not understood
- 5 Not sure
- 6 No answer

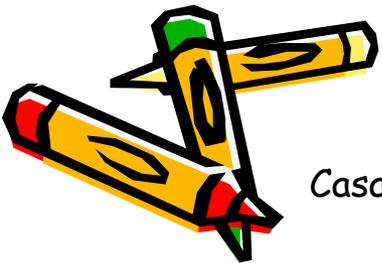

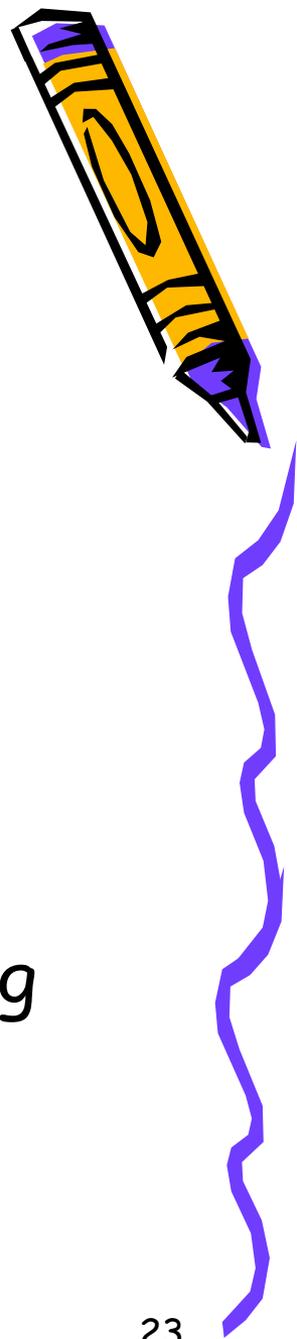

Casablanca, 2007

Retrospection

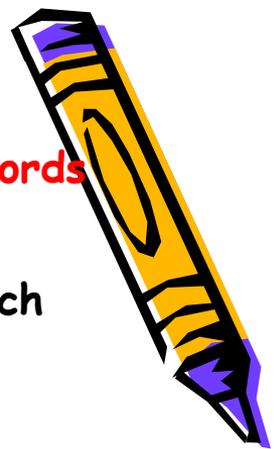

What would have been necessary?

- a **larger population**
- **numerical measuring** tools applied in addition to verbal
- **predefined criteria** for objective **evaluation** of the responses
- a **more elaborate** instrument (questionnaire) for the data collection
- more **precise** and **reliable** results by using **a numerical scale**

Conclusion

- In summarizing data by **substituting very few measures for many words** in the answers elicited from the examinees, certain information is inevitably lost.
- What is even more serious, it is very possible to obtain results which are **misleading unless cautiously interpreted**. The limitations of the summarizing measures must be clearly indicated.
- The students read **different** articles, not the same one.
- The **questions were general** in order to get insight about understanding scholarly articles.
- The descriptive responses of the examinees were interpreted subjectively. Statistical inference performed on the basis of these results may **not be statistically reliable**.
- It can still be useful for **analyzing which sections** of a scholarly article were **most difficult** to the examinees.
- The results can be **instructive for orientation** in devising curricula to make the students aware of **how to achieve better understanding** of scholarly articles.
- **Relevant** scholarly **concepts** had to be introduced with more details and examples.
- A highly **sophisticated** statistical analysis may be an **aid** to, but never a substitute for good sound thinking.

„It is *not essential* for the value of an education *that every idea be understood* at the time of its accession. Any person with a genuine intellectual interest and a wealth of intellectual context acquires much that *he only gradually comes to understand* fully in the light of its *correlation* with other related ideas ...

Scholarship is a progressive process, and it is the art of connecting and recombining individual items of learning by the force of one's whole character and experience that nothing left in isolation, and each idea becomes a commentary of many others."

Norbert Wiener (1894-1964)

American mathematician who founded cybernetics.
